

Carriage House: Deployment Guide

Carriage House: Deployment Guide

Everything needed to get the current system live. Three files, one Sheet update, one piece of missing information only you have.

1. Webhook: already done

inquiry.html is already configured with the real Apps Script Web App URL:

```
const WEBHOOK_URL =
'https://script.google.com/macros/s/AKfycbxts1bUS03dm6bkFDWxcBQaCj3V11z8oIs9QG8LzPwnxzQ3xieRzgl0'
```

Nothing to do here: just push the file as-is.

The backend script itself needed no changes. The new form sends the exact same field names your existing doPost handler already expects: the payload just includes a few now-blank keys (doorStaff, outsideVendors, guestMethod, ageReq, insurance, payMethod) for fields the form no longer asks about, sent as empty strings so column alignment stays intact.

2. Files to push

File	What it is	Action
index.html	The hub: Kanban pipeline dashboard	Replace
portal.html	Quote, Contract, Invoice: one tool, three stages	Replace (or add: see below)
inquiry.html	Client-facing lead form	Replace: already has the real webhook URL baked in

Code.gs and the Apps Script project are unchanged. No redeploy needed there.

Safe to delete (nothing references them anymore): - quote.html, contract.html: replaced entirely by portal.html - docx.umd.js, FileSaver.min.js: contract used to generate a .docx; it now renders in-browser with Copy and Print/PDF instead

No config to re-enter in index.html: Client ID, Sheet ID, and tab name are already the real values, not placeholders.

3. Sheet columns: check before you deploy

Your Inquiries tab needs to physically extend to column **AI**. If it stops short of that, every save from the hub or portal will fail with a 400 ... exceeds grid limits error the moment it tries to write past the edge.

Full current layout:

Cols	Contents	Written by
A-Y	Inquiry form fields (name, contact, event details, etc.)	inquiry.html to Apps Script
Z-AE	status, quoteTotal, quoteData, contractGenerated, lastUpdatedBy, calendarEventId	hub / portal
AF-AG	invoiceData, invoiceTotal	portal (invoice stage)
AH-AI	starred, followupDate	hub

If AF-AI already exist from an earlier deploy, you're set. If this is your first time deploying since the portal migration, add headers invoiceData (AF1), invoiceTotal (AG1), starred (AH1), followupDate

(AI1), and confirm the grid reaches column AI (right-click the last column and choose *Insert columns right* if it doesn't).

Existing rows are unaffected either way: every read falls back to ''/null for anything not yet populated.

4. What's actually in this version

A lot has changed since the last time this was documented. In brief:

Visual system. Hub and portal both run the same dark spec-sheet theme: Bebas Neue, Space Mono, Inter, amber accent on near-black. Wordmark is "CARRIAGE HOUSE" throughout, matching the venue name rather than the entity name.

Pipeline stages. Four visible by default (New / Quoted / Contracted / Invoiced), plus two collapsed-by-default stages, **Stale** and **Dead**, each with its own toggle in the sort bar. Any inquiry already marked cancelled from a prior version folds into Dead automatically.

Stars and follow-ups are Sheet-backed, not browser-local. Shared across devices and visible to anyone who opens the hub, same as everything else.

Quote pricing tiers: Up to 50 (\$3,000) / Up to 150 (\$4,500) / Full venue up to 300 (\$6,500). The inquiry form's guest-count choices map onto these exact breakpoints.

"What's the occasion?" on the inquiry form is a plain text field: no preset categories. Whatever's typed flows through untouched to the hub, the portal, and both emails.

Emailled PDFs are real snapshots, not text reconstructions. Both the quote and contract emails attach a rendered copy of the actual on-screen document, same fonts, same layout, same numbers: captured via the same rules that already drive the in-app Print/PDF button, so the two can't drift out of sync.

Email copy is direct, no filler, no em dashes anywhere in the system (subject lines, bodies, or otherwise): signed off with a phone number for anyone who'd rather call.

Two hub-level extras: an "Inquiry" panel inside the portal (readable reference to the original form submission, doesn't touch anything), and a "Quick tool" button on the hub's main toolbar for building a one-off quote/contract/invoice with no tracked inquiry behind it at all.

5. Smoke test after deploy

1. Sign in to the hub. Board loads, four columns, Stale/Dead toggles present.
2. Open a **new** inquiry, then Quote, Contract, Invoice: confirm data carries through each stage.
3. Star it, set a follow-up date, refresh the page: both should still be there (proves the Sheet write worked, not just local state).
4. **Email quote + hold:** check the Gmail draft: subject reads clean (no garbled characters), PDF attachment looks like the actual quote document, not a plain-text dump.
5. Open an **old** pre-existing inquiry: confirm it still loads and saves without error.
6. Submit a real test through `inquiry.html`: confirm it lands correctly in the Sheet and shows up on the board as **New**.
7. From the hub, click **Quick tool**: confirm it opens the portal with a blank slate, no leftover data from whatever you were just looking at.
